Exercise related to lecture 2 and 4

HA 4.sem.

AALBORG UNIVERSITY

- Today:
- Creativity – need, triggers, barriers
- Funding – sources, basic problems, implications for entrepreneurs

- ***Now***: **Exercise** **related to lectures 2, 4, on characteristics of entrepreneurs, entrepreneurial processes etc.**

The **purpose** of the exercise is basically to use available data to confront our ‘theoretical’ propositions on what are entrepreneurs’ motivation, background, entrepreneurial processes etc. on actual data on this!

Individually or in groups.

Now or later. Jesper available for consultation now.

Re-cap on the data to be used = GEM data
GEM Research and data – the survey part

- Extensive Adult Population Surveys: A minimum of 2,000 adults were selected in each country for a random sampling survey using a common survey guide. Use of a mix of face-to-face or telephone interviews, in cases and increasingly supplemented by online participation
  - ✓ The results of the analysis are drawn from the responses of the working age group (18 to 64 years old).
  - ✓ In 2024 a total of 150.000 individuals in 51 countries were surveyed by GEM. (now not done in Denmark!). Collectively represent more than 63% of the world's population, more than 77% of global GDP
  - ✓ Different to other statistics: "APS captures the attitudes, behaviours and expectations of individual adults, which makes it very different from surveys of businesses and firms, and different from official government statistics such as business registrations. This is important because the APS data provide insight into the individual decision to start or continue a business, and the entrepreneurial journey from intentions through to business conception, and business birth.." GEM, 2021, p.21

One of the variables in GEM is Total early-stage Entrepreneurial Activity (TEA)

The TEA rate is the proportion (%) of the adult population in a country who are either actively engaged in starting a new business (the nascent entrepreneur) or owning and managing a new business (the new business owner), minus any who are doing both (to avoid double counting).

But a number of other variables are available. E.g. ‘Fear of failure’

You can link country/region – year – APS variable

Adult Population Survey (APS) looks at the characteristics, motivations and ambitions of individuals starting businesses, as well as social attitudes towards entrepreneurship

Your task!

Go to the data = https://www.gemconsortium.org/data/key-aps

(= 'data' -> 'custom data tables'. These parts of the data are producing tables. In a semester project you'd also need the micro-data)

- Spend a little time to re-cap some of the discussions we've had on what are entrepreneurial characteristics, motivations and aspirations
  - Example = necessity-/opportunity based-entr; other propositions – your own…
- See if you can test if they hold in practice – does the GEM data support the proposition you've learned and chosen from the literature?
- Note that not all countries participate in all years
- Look for interesting stories -

- Write down the hypothesis/correlation that you are trying to investigate.
- Reproduce the table/numbers you found
- Write a few lines on the results: confirmed? Not? Why? What are possible explanations to results?
- Test a few, 1-3 hypotheses.
